(54) Title: HETEROCYCLINDAZOLE AND AZAINDAZOLE COMPOUNDS AS 5-HYDROXYTRYPTAMINE-6 LIGANDS

(57) Abstract: The present invention provides a compound of formula I and the use thereof in the therapeutic treatment of disorders related to or affected by the 5-HT6 receptor.

HETEROCYCLYLINDAZOLE AND -AZAINDAZOLE COMPOUNDS AS  
5-HYDROXYTRYPTAMINE-6 LIGANDS

5

This invention relates to heterocyclylindazole and -azaindazole compounds useful as 5-hydroxytryptamine-6 ligands, to processes for preparing them, to pharmaceutical compositions containing them and to methods of treatment using them.

10

BACKGROUND OF THE INVENTION

15

A number of central nervous system disorders such as anxiety, depression, motor disorders, etc., are believed to involve a disturbance of the neurotransmitter 5-hydroxytryptamine (5-HT) or serotonin. Serotonin is localized in the central and peripheral nervous systems and is known to affect many types of conditions including psychiatric disorders, motor activity, feeding behavior, sexual activity, and neuroendocrine regulation among others. The effects of serotonin are regulated by the various 5-HT receptor subtypes. Known 5-HT receptors include 5-HT<sub>1</sub>, 5-HT<sub>2</sub>, 5-HT<sub>3</sub>, 5-HT<sub>4</sub>, 5-HT<sub>5</sub>, 5-HT<sub>6</sub> and 5-HT<sub>7</sub> subtypes.

20

The recently identified human 5-hydroxytryptamine-6 (5-HT<sub>6</sub>) receptor subtype has been cloned, and the extensive

distribution of its mRNA has been reported. Highest levels of 5-HT<sub>6</sub> receptor mRNA have been observed in the olfactory tubercle, the striatum, nucleus accumbens, dentate gyrus and CA1, CA2 and CA3 regions of the hippocampus. Northern blots 5 have revealed that 5-HT<sub>6</sub> receptor mRNA appears to be exclusively present in the brain, with little evidence for its presence in peripheral tissues.

The high affinity of a number of antipsychotic agents for the 5-HT<sub>6</sub> receptor, in addition to its mRNA localization 10 in striatum, olfactory tubercle and nucleus accumbens suggests that some of the clinical actions of these compounds may be mediated through this receptor. Compounds which interact with, stimulate or inhibit the 5-HT<sub>6</sub> receptor are commonly referred to as 5-HT<sub>6</sub> ligands. These 5-HT<sub>6</sub> 15 receptor ligands are believed to be of potential use in the treatment of a variety of central nervous system disorders such as anxiety, depression, epilepsy, obsessive-compulsive disorders, migraine, cognitive disorders, sleep disorders, feeding disorders, panic attacks, disorders relating to 20 withdrawl from drug abuse, schizophrenia, or the like or in the treatment of certain gastrointestinal disorders such as irritable bowel syndrome.

Therefore, it is an object of this invention to provide 25 compounds which are useful as therapeutic agents in the treatment of a variety of central nervous system disorders related to or affected by the 5-HT<sub>6</sub> receptor.

It is another object of this invention to provide therapeutic methods and pharmaceutical compositions useful for the treatment of central nervous system disorders 30 related to or affected by the 5-HT<sub>6</sub> receptor.

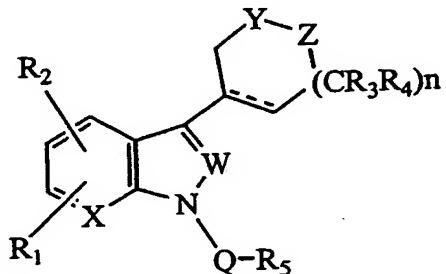

It is a feature of this invention that the compounds provided may also be used to further study and elucidate the 5-HT<sub>6</sub> receptor.

These and other objects and features of the invention will become more apparent by the detailed description set forth hereinbelow.

#### DETAILED DESCRIPTION OF THE INVENTION

The 5-hydroxytryptamine-6 (5-HT<sub>6</sub>) receptor is one of the most recent receptors to be identified by molecular cloning. Its ability to bind a wide range of therapeutic compounds used in psychiatry, coupled with its intriguing distribution in the brain has stimulated significant interest in new compounds which are capable of interacting with or affecting said receptor. At present, there are no known fully selective agonists. Significant efforts are being made to understand the possible role of the 5-HT<sub>6</sub> receptor in psychiatry, cognitive dysfunction, motor function and control, memory, mood and the like. To that end, compounds which demonstrate a binding affinity for the 5-HT<sub>6</sub> receptor are earnestly sought both as an aid in the study of the 5-HT<sub>6</sub> receptor and as potential therapeutic agents in the treatment of central nervous system disorders.

Surprisingly, it has now been found that heterocyclylindazole or -azaindazole compounds of formula I demonstrate affinity for the 5-HT<sub>6</sub> receptor along with significant receptor sub-type selectivity. Advantageously, said formula I compounds are effective therapeutic agents for the treatment of central nervous system (CNS) disorders associated with or affected by the 5-HT<sub>6</sub> receptor. Accordingly, the present invention provides heterocyclylindazole or -azaindazole compounds of formula I

20      protected 1-sulfonyl derivative of formula V; and deprotecting the formula V compound to give the desired formula Ia product. Alternatively, the formula V compound may be reduced to give the formula VI protected piperidin-4-yl derivative and deprotection of the formula VI compound  
25      affords the compound of formula I wherein n is 1; Q is SO<sub>2</sub>; Y is CH<sub>2</sub>, Z is NH; and ---- represents a single bond (1b). The reaction schemes are shown in flow diagram I wherein G represents a protecting group.

The reaction sequence is shown in flow diagram III wherein G represents a protecting group.

FLOW DIAGRAM III

LiAlH<sub>4</sub> to give the 3-pyrrolidinyl compound of formula XI and sulfonating and deprotecting as described hereinabove to give the desired product of formula Ie. The reactions are shown in flow diagram IV wherein G represents a protecting group.

**FLOW DIAGRAM IV**

10

EXAMPLE 58Comparative Evaluation of 5-HT<sub>6</sub> Binding Affinity of Test Compounds

5

The affinity of test compounds for the serotonin 5-HT<sub>6</sub> receptor is evaluated in the following manner. Cultured Hela cells expressing human cloned 5-HT<sub>6</sub> receptors are harvested and centrifuged at low speed (1,000 x g) for 10.0 min to remove the culture media. The harvested cells are suspended in half volume of fresh physiological phosphate buffered saline solution and recentrifuged at the same speed. This operation is repeated. The collected cells are then homogenized in ten volumes of 50 mM Tris.HCl (pH 7.4) and 0.5 mM EDTA. The homogenate is centrifuged at 40,000 x g for 30.0 min and the precipitate is collected. The obtained pellet is resuspended in 10 volumes of Tris.HCl buffer and recentrifuged at the same speed. The final pellet is suspended in a small volume of Tris.HCl buffer and the tissue protein content is determined in aliquots of 10-25 µl volumes. Bovine Serum Albumin is used as the standard in the protein determination according to the method described in Lowry et al., J. Biol. Chem., 193:265 (1951). The volume of the suspended cell membranes is adjusted to give a tissue protein concentration of 1.0 mg/ml of suspension. The prepared membrane suspension (10 times concentrated) is aliquoted in 1.0 ml volumes and stored at -70° C until used in subsequent binding experiments.

Binding experiments are performed in a 96 well microtiter plate format, in a total volume of 200 µl. To each well is added the following mixture: 80.0 µl of

incubation buffer made in 50 mM Tris.HCl buffer (pH 7.4) containing 10.0 mM MgCl<sub>2</sub> and 0.5 mM EDTA and 20  $\mu$ l of [<sup>3</sup>H]-LSD (S.A., 86.0 Ci/mmol, available from Amersham Life Science), 3.0 nM. The dissociation constant, K<sub>D</sub> of the [sup>3]H]LSD at the human serotonin 5-HT<sub>6</sub> receptor is 2.9 nM, as determined by saturation binding with increasing concentrations of [<sup>3</sup>H]LSD. The reaction is initiated by the final addition of 100.0  $\mu$ l of tissue suspension. Nonspecific binding is measured in the presence of 10.0  $\mu$ M methiothepin.

10 The test compounds are added in 20.0  $\mu$ l volume.

The reaction is allowed to proceed in the dark for 120 min at room temperature, at which time, the bound ligand-receptor complex is filtered off on a 96 well unifilter with a Packard Filtermate® 196 Harvester. The bound complex 15 caught on the filter disk is allowed to air dry and the radioactivity is measured in a Packard TopCount® equipped with six photomultiplier detectors, after the addition of 40.0  $\mu$ l Microscint®-20 scintillant to each shallow well. The unifilter plate is heat-sealed and counted in a 20 PackardTopCount® with a tritium efficiency of 31.0%.

Specific binding to the 5-HT<sub>6</sub> receptor is defined as the total radioactivity bound less the amount bound in the presence of 10.0  $\mu$ M unlabeled methiothepin. Binding in the presence of varying concentrations of test compound is 25 expressed as a percentage of specific binding in the absence of test compound. The results are plotted as log % bound versus log concentration of test compound. Nonlinear regression analysis of data points with a computer assisted program Prism® yielded both the IC<sub>50</sub> and the K<sub>i</sub> values of 30 test compounds with 95% confidence limits. A linear

regression line of data points is plotted, from which the IC<sub>50</sub> value is determined and the K<sub>i</sub> value is determined based upon the following equation:

$$K_i = IC_{50} / (1 + L/K_D)$$

5 where L is the concentration of the radioactive ligand used and K<sub>D</sub> is the dissociation constant of the ligand for the receptor, both expressed in nM.

Using this assay, the following Ki values are determined and compared to those values obtained by  
10 representative compounds known to demonstrate binding to the 5-HT<sub>6</sub> receptor. The data are shown in Table IV, below.

# INTERNATIONAL SEARCH REPORT

national application No.  
PCT/US 01/47935

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  

Although claims 13-17 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compounds.
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
